#### **Missouri and Big Sioux Rivers Update #4**

We have no indication that the Missouri River predictions will change from 30.6 river stage at Sioux City.

The river elevations are projected to possibly exceed our levee and riverbank protection.

If the projected elevations are realized and they overtop and/or breach the protection, some low lying roads will become inundated making travel impossible and the sanitary sewer system will need to be isolated in residential areas to preserve the infrastructure.

- For your safety, we are advising all residents to relocate as soon as possible, but **not later than 11:00 am Sunday morning, September 15<sup>th</sup>**.
  - This could last for five days or more, so prepare accordingly.
  - Dakota Dunes Community Improvement District Board of Supervisors are not confident that our protection can withstand the high water level a third time this year.
- Residents should plug floor drains and turn off irrigation systems before you depart.
- Turn off dehumidifiers, water softeners and air conditioners to protect your homes.
- The evacuation & River levels are not expected to affect the Commercial areas or Dakota Dunes hotels.

NWS Missouri River Projection can be found at
