### **Missouri and Big Sioux Rivers' Update #10**

Both the Big Sioux and the Missouri Rivers continue to flow at about their crest level. These levels are predicted to remain through tomorrow and then slowly recede. The Corps has begun to increase releases per their previous schedule. That should be reflected in the projected river levels moving forward. However, rain is in the forecast through the weekend which could impact the projected levels. River levels are still extremely high and maintenance on the preventive measures are still on-going. It is important to continue to prepare as we have discussed in previous alerts with relocation still a choice you will need to make.

- The sanitary sewer system will only be shut down if the river breaches the protection in residential areas to preserve the infrastructure.
- We do not believe water, gas and electric will be impacted at this time.
- We recommend floor drains remain in place.
- There is rain in the forecast the next three days, please leave your irrigation systems off.
- Please check on your elderly neighbors as they may not get notices electronically.
